Exact Polytope Membership Queries

Given a polytope P in d -dimensional space, **preprocess** P to answer **membership queries**:

Given a point q , is $q \in P$?

- Assume that **dimension** d is a **constant** and P is given as intersection of n halfspaces
- Dual of **halfspace emptiness** searching
- For $d \leq 3$
Query time: $O(\log n)$ Storage: $O(n)$
- For $d \geq 4$
Query time: $O(\log n)$ Storage: $O(n^{\lfloor d/2 \rfloor})$

Approximate Version

- An **approximation parameter** $\epsilon > 0$ is given
- Assume the polytope has **diameter 1**
- If the query point's distance from P :
 - 0 : answer must be **inside**
 - $\geq \epsilon$: answer must be **outside**
 - > 0 and $< \epsilon$: **either** answer is acceptable

- **Time-efficient**
Optimal query time: $O(\log \frac{1}{\epsilon})$
- **Space-efficient**
Optimal storage: $O(1/\epsilon^{(d-1)/2})$

Approximate Nearest (ANN) Neighbor Searching

Approximate Nearest Neighbor

Preprocess n points such that, given a query point q , we can find a point within at most $1 + \varepsilon$ times the distance to q 's nearest neighbor

- Applications to pattern recognition, machine learning, computer vision...
- Huge literature (theory, applications, heuristics...)

- Hierarchy construction takes:

$$O\left(n + 1/\varepsilon^{\frac{3(d-1)}{2}}\right) \text{ time}$$

- Input polytope may be described as:

- Intersection of n halfspaces
- Convex hull of n points

- Too slow to efficiently build ε -kernel

Results

Our **approximate polytope membership** data structure is **optimal**

- Query time: $O(\log \frac{1}{\varepsilon})$
- Storage: $O(1/\varepsilon^{\frac{d-1}{2}})$
- Preprocessing: $O(n \log \frac{1}{\varepsilon} + 1/\varepsilon^{\frac{d-1}{2} + \alpha})$

We showed how to use it to obtain:

- ANN searching in $O(\log n)$ query time with $O(n/\varepsilon^{d/2})$ storage
- Near-optimal ε -**kernel** construction in $O\left(n \log \frac{1}{\varepsilon} + 1/\varepsilon^{\frac{d-1}{2} + \alpha}\right)$ time
- **Diameter** approximation in $O\left(n \log \frac{1}{\varepsilon} + 1/\varepsilon^{\frac{d-1}{2} + \alpha}\right)$ time
- **Bichromatic closest pair** approximation in $O\left(n/\varepsilon^{\frac{d}{4} + \alpha}\right)$ expected time
- Euclidean **minimum spanning/bottleneck tree** approximation in $O\left((n \log n)/\varepsilon^{\frac{d}{4} + \alpha}\right)$ expected time

Construction

Diameter

Conclusions

Results

Open Problems

References

Still, several **open problems** remain

- Faster **preprocessing**
- Further improvements to **approximate nearest neighbor** searching
- Generalization to **k -nearest neighbors**
- Lower bound for **diameter** (or improved upper bound)
- Diameter for **non-Euclidean metrics**
- Other applications of the **hierarchy**

Ongoing work:

- Approximate the **width**
- Approximate **polytope intersection**
- ANN with **non-Euclidean metrics**
